

BLINKIT SALES & OPERATIONS ANALYSIS

BUSINESS PROBLEM & ANALYTICAL OBJECTIVES

1. BUSINESS CONTEXT

Quick-commerce and retail businesses generate large volumes of data related to products, sales, outlets, locations, and customer-facing operations.

Analysing this data can help identify performance patterns, understand product and outlet characteristics, and support better business decision-making.

This project focuses on analysing Blinkit business data to understand sales performance and operational patterns across different product and outlet dimensions.

2. BUSINESS PROBLEM

The key challenge addressed in this project was:

How can sales and outlet-related data be analysed to identify important business performance patterns and support better understanding of retail operations?

3. ANALYTICAL OBJECTIVES

The project aimed to:

- Analyse overall sales performance.
- Understand the contribution of different product categories.
- Compare outlet performance across different characteristics.
- Analyse the relationship between outlet attributes and sales performance.
- Identify important business KPIs.
- Create visual dashboards for easier interpretation of the data.
- Generate meaningful observations from the analysis.

4. KEY BUSINESS QUESTIONS

The analysis was designed to explore questions such as:

- What is the overall sales performance?
- Which product categories contribute most to sales?
- How does outlet size affect business performance?
- How do different outlet locations compare?
- Which outlet characteristics are associated with stronger performance?
- What patterns can be identified from product and outlet data?
- How can the analysis be presented through dashboards?

5. DATA ANALYSIS APPROACH

The project followed a structured analytical process:

Step 1: Data Inspection

The raw dataset was reviewed to understand its structure, variables, and business dimensions.

Step 2: Data Cleaning

The data was prepared and cleaned to improve consistency and make it suitable for analysis.

Step 3: Exploratory Analysis

PivotTables and summary analysis were used to explore patterns across products, categories, outlets, and other business dimensions.

Step 4: Dashboard Development

The analysis was converted into visual dashboards using Microsoft Excel and Power BI.

Step 5: Business Interpretation

The visualisations were reviewed to identify relevant patterns and performance observations.

6. PRIMARY TOOLS

Microsoft Excel | Power BI

7. PROJECT OUTPUT

The final output includes cleaned data, analytical summaries, Excel-based analysis, and Power BI dashboard visualisations.
